**Aesthetics, Skeletal anchorage,  
Artificial intelligence and 3D  
technology: have our clinics  
changed?**

### RESUMO DA CONFERÊNCIA

A high percentage of adult patients who come to our practice have skeletal malocclusions. About 70% of them are adults and young people. About 30% of these patients have a skeletal malocclusion. We have 2 options to treat these patients: orthodontics only or a surgical approach. In this lecture I will present a group of adults and young adult patients, most of them with maxillary hypoplasia treating all of them with different options but focusing on the use of 3D technology to develop a predictable treatment. We will also show how we use the 3D technology to develop a bone supported customized expander with surgical guides to do a direct method .
